Wooden Slat Panels

by OLG.

Wooden Slat Panels.

A modern, stylish, eco-friendly acoustic solution sourced from certified, sustainable products.

The OLG AcoustiQ wooden slat panels combine aesthetics with functionality, offering effective acoustic treatment for any space. Constructed with a durable 9mm thick polyester fibre panel base and topped with 12mm thick MDF board slats, these panels are designed for both visual appeal and sound management. The slats, measuring 27mm in width with a 13mm gap between each, help to enhance the acoustics by reducing ambient noise levels.

Ideal for adding a modern touch to interiors, the AcoustiQ panels are versatile, available in various colours, and can be easily mounted on both walls and ceilings to improve the look and sound of any room.

The standard size of each panel is 2730mm x 600mm x 21mm.

The base of the product consists of a 9mm thick polyester fibre panel and the wooden slats are manufactured from 12mm thick MDF board.

The slats themselves are 27mm wide with an approximate gap of 13mm between each slat.

Sound Absorption.

Our AcoustiQ wooden slat panels offer Class A sound absorption through a combination of specialised materials and intelligent design.

Whether you have a noisy office full of echoes, reverberations or the ambient hum of distant conversations, AcoustiQ wooden slat panels work hard to intercept and diffuse unwanted sound waves through your working environment.
